

Deep-dive record richness scales with confidence tier

Real per-gene distributions from the 1175 deep dives, faceted by deep-dive tier (median line inside each violin; faint dots = the real per-tier values). Panels a/b keep the 'no' tier; panels c-e drop it since non-surface proteins carry little extracellular evidence by definition. The 'uncertain' tier (n=9) is dropped everywhere as too small to plot. PRELIMINARY - 1175 of ~5,128 swept, pre-QA-fix.
